

Go POGO! ^[1]

Submitted by Rory Lattimer Wed, 2012-07-18 00:00

POGO (Profiling Oceanographic Observatory) is alive and well! The vertical profiling system, installed at a depth of 396 m on Barkley Upper Slope is now sending its instrument float on regular journeys from seafloor to surface and back. And some interesting new data products are available for examining a host of water properties through the depth of the water column.
